ACKNOWLEDGEMENT

ABSTRACT

As the name specifies "HOSTEL MANAGEMENT SYSTEM" is a software developed

for managing various activities in the hostel. For the past few years the number of educational institutions are increasing rapidly. Thereby the number of hostels are also increasing for the accom modation of the students studying in this institution. And hence there is a lot of strain on the person who are running the hostel and

software's are not usually used in this context. This particular project deals with the problems on managing a hostel and avoids the problems which occur when carried manually.

Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system Which is more user friendly and more GUI oriented. We can improve the efficiency of the system, thus overcome the drawbacks of the existing system.

- Less human error

- Strength and strain of manual labour can be reduced

- High security

- Data redundancy can be avoided to some extent

- Data consistency

- Easy to handle

- Easy data updating

- Easy record keeping

- Backup data can be easily generated

CHAPTER 8

CHAPTER 1

INTRODUCTION

Since, from existence of humans many methodologies, technologies are being evolving. Keeping tomorrow in view humans are like apes, without technology.Considering this evolving technology our big ledgers, registers are gradually disappearing. It is sad to lose the traditional practices.

Ourselves COMPUTER ENGINEERS are trying to maintain the same traditional practices but with new techniques, & even with new technology.Taking decision is easy but the decision is best, only when taken decision will be favorable it is only possible with human perception & thinking.Many a times human's decision are not favourable for personnel the solution for this scenario is Decision Support System (DSS). The method Decision Support System (DSS) enables the ease of taking complex decisions. This system's DSS is designed in such a way that it meets the quality of best decision among the pool.

Every integrated campus also includes hostels. Security of every student is of course needed. As per today's techniques manual paper documentation is maintained for monitoring student activity in hostel as well thought the campus. This manual documentation may have some errors this can be neglected by usingthis system which finely designed to maintain the activity of the student. It will be harder to switch from one format of documentation to another format if any changes in existing format of documentation that to all documentation scripted manually.

Therefore, for eliminating this problem we are in try to make all the documentations to be scripted with less human power & with fewer efforts. Even if the person is trained in, such a way that he can adapt to any changes easily it is good but, what about the manual errors? There is no otheroption rather than atomization. Yes, the solution of atomization is with us.

As described in abstract our tool is mainly developed for providing atomized system for education institutions for monitoring activities of students. It is not only about atomization, it also matters how personnel feels with the system. We have tried our level best to maintain a very good interaction & easy interface with the personnel. As Bill Gates says 'SOFTWARE IS GREAT COMBIMATION BETWEEN ARTISTRY & ENGINEERING'. Our design is in such say way thatboth artistry & engineering are transparent. It is false that software totally rely on engineering, the art of representing the engineering techniques are also equally important for reflecting the nature of software.

The Hostel Management framework is a web application which is created for managing different activities in the hostel. This project is expected to limit human works and make hostel allocation much easier for student and hostel administrators with the help of the web application to hostel, naturally select the student from the waiting list and mess billing, outpass generation, complaint registration, and so forth. Student will get endorsement notice in their mails. It advises guardians with respect to their wards and their presence in hostel and their curricular will be informed to their parents using this model just in one touch. In last, few years the number of educational establishments is expanding quickly. In this way, the quantity of hostels is additionally expanding for the settlement of the student considering in this college. Also, henceforth there is a considerable measure of strain on the individual who are running the hostel and websites are not generally utilized as a part of this specific circumstance. This specific project manages the issues on dealing with a hostel and helps to deal from the issues which happen when conveyed manually

OBJECTIVES AND SCOPE OF THE STUDY

- To eliminated hard-core
- documentation like Excel Sheets,
- ledgers.
- To get precise results.
- To reduce manual effort.
- To avoid human errors.
- To achieve security to data.
- To get results in graphical manner i.e.
- Bar Graph, Pie Chart.
- To generate reports in generic form.

User Panel

User Login

Home

1. This consist of the different pop-up menus showing the details of the different hostels

2. It contain a link to the our college official web-site.

3. It allows the different users to access the registration forms.

4. He can view the Student administration division of the different hostels and also view the notice Boards.

Registration Form

This section provides an online form to the students which can be filled by them,and a copy of the filled page can be taken in the printed form. This is later submitted to the Hostel authorities which can be by them before alotting them to the respective hostels.

Notice Board

All the hostels have their Notice boards. Any change in the Hostel fee,mess fee will be shown in this. It can be also used for different notifications.

Admin Panel

Administrator Login

Home

The Administrator can :

1.Allot different students to the different hostels.

2. Vacate the students for the hostels.

3. Control the status of the fee payement.

4. Edit the details of the students & modify the student records.

Allotment of the hostels

Their will be pre-defined criterias for the admissionto the hostels. He checks the attested application forms of the students obtained from the internet and varify it with the student database. If the students are found eligible then they are allotted to the hostel.

Vacating the rooms

As the student's course is over they will vacate their rooms. So it is required for the administrator toremove their records from the database tables. This section includes the option for the room vacation and he deletion of the particular record from the database.

CHAPTER 2

LITERATURE SURVEY

Every institute uses their own way of documentation to maintain activity of student.Documentation will be effective manner, but if this will be transferred to atomized mode the output of the maintain activity will be more effective than existing method. Some of monitoring services are even provided by online means, the online means does not provide that effectiveness because it is puzzling.

Even though we use the online services there will be a requirement of internet connectivity. Further, about offline services, there are some offline services, which provide the same service as online systems. These offline systems are mostly supportable for very less number of users at a time.The multi user handling systems provides uses that are more effective.

CHAPTER 3

SYSTEM ANALYSIS

PROPOSED SYSTEM

It is proposed to simplify the procedures involved in Acquiring an out-pass for the hostel students, while at the same time maintain paramount and for-sure security methodologies.We wish to do the above by means of a mobile application. This application will allow students to send out-pass requests with just a button click. Also, it simplifies all the processes of hostel management, including attendance maintenance at regular intervals.

The pass is approved automatically by the system if the requested student has eligible number of pass credits of that current month. However, if the passes exceeds the monthly limit or request is raised during working hours, the system forwards the request to the warden. As the request gets approved, the parent of the ward will be intimated with the exit time of the student at guard desk. A list containing the student's details and their out-pass status will be updated to the warden and the security guard at regular intervals. The student's entry and exit to and from the campus is monitored with the help of application at the security guard desk.

SUMMARY

◇ The system, which enables the precise outcome.

◇ The high throughput model.

◇ Multi user handling capacity.

◇ User friendly.

◇ More efficient output than existing system.

◇ Easy adaptable environment.

◇ And also to predict the fore coming.

EXISTING SYSTEM

For the past few years the number of educational institutions are increasing rapidly. Thereby the number of hostels are also increasing for the accommodation of the students studying in this institution. And hence there is a lot of strain on the person who are running the hostel and software's are not usually used in this context. This particular project deals with the problems on managing a hostel and avoids the problems which occur when carried manually Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system which is more user friendly and more GUI oriented.

We can improve the efficiency of the system, thus overcome the following drawbacks of the existing system.

· more human error.

· more strength and strain of manual labour needed

· Repetition of the same procedures.

· low security

· Data redundancy

· difficult to handle

· difficult to update data

· record keeping is difficult

i)*Student-side:*

The students have to search for the warden who may be teaching faculty throughout the Vast spread campus. The student has to carry the letter around for providing proof when enquired.

ii) *Warden-side:*

The wardens may be teaching faculties, research assistants, office staff etc. They might find the time that the student chooses to get his/her authorization very nagging. They find it very difficult to keep a manual record of the attendance in thehostel

They have to take more effort and thoroughly monitor students to ensure extreme security.

iii) Parent-side:

The parents may find it non-comforting to not know about the whereabouts of their children.

CHAPTER 4

SYSTEM DESIGN

INTRODUCTION

The general protocol to get an out-pass in any organization is to get a manual written letter from the student requesting an out-pass signed by the respective warden in-charge of the student. This process can become quite tedious when the campus size is large.

As the students will have to go in search of the wardens in person. Also, in most cases the warden inauthorization procedure to be intruding in their professional work times. Time is an important factor playing here affecting both student and the warden. To avoid this problem to occur , we are implementing an android application .We propose to implement this project using Java with Android SDK offers even more features that enhance your productivity when building android apps, for the front end of the app and hp and my sql for the back end with flask framework.

As we all Know that nowadays every individual carrytheir own smart phones and the uses of android applications have been increased rapidly so it is better to have such an android application which will provide a safe environment . Having the application on your phone can diminish our risk and bring assistance when we require.

SYSTEM REQUIREMENTS

HARDWARE REQUIREMENTS :

        1. Pentium IV Processor

        2. 512 MB RAM

        3. 40GB HDD

        4. 1024 * 768 Resolution Color Monitor

SOFTWARE REQUIREMENTS:

1.OS : Windows XP

2.PHP Triad (PHP, MySQL,Apache,PHPMyAdmin)

Front End

Language – PHP.

Also includes technologies like Bootstrap, CSS, HTML5, and Java Script.

Back End

Microsoft SQL Server.

SQL Database.

Apache local Server

Software Features

PHP TRIAD

PHPTriad installs a complete working PHP/MySQL server environment on Windows platforms (9x/ NT). Installs PHP, MySQL, Apache, and PHPMyAdmin.

PHP

PHP is a scripting language originally designed for producing dynamic web pages. It has evolved to include a command line interface capability and can be used in standalone graphical applications. While PHP was originally created by Rasmus Lerdorf in 1995, the main implementation of PHP is now produced by THE PHP group and serves as the de facto standard for PHP as there is no formal specification. PHP is free software released under the PHP License, however it is incompatible with the GNU General Public License (GPL), due to restrictions on the usage of the term **PHP**.

It is a widely-used general-purpose scripting language that is especially suited for web development and can be embedded into HTML. It generally runs on a web server, taking PHP code as its input and creating web pages as output. It can be deployed on most web servers and on almost every operating system and platform free of charge. PHP is installed on more than 20 million websites and 1 million web servers.

PHP originally stood for Personal Home Page. It began in 1994 as a set of Common Gateway Interface binaries written in the C programming language by the Danish/Greenlandic programmer Rasmus Lerdorf. Lerdorf initially created these Personal Home Page Tools to replace a small set of Perl scripts he had been using to maintain his personal homepage. The tools were used to perform tasks such as displaying his résumé and recording how much traffic his page was receiving. Hecombined these binaries with his Form Interpreter to create PHP/FI, which had more functionality. PHP/FI included a larger implementation for the C programminglanguage and could communicate with databases, enabling the building of simple,dynamic web applications.

Lerdorf released PHP publicly on June 8, 1995 to accelerate bug location and improve the code. This release was named PHP version 2 and already had the basic functionality that PHP has today. This included Perl-like variables, form handling, and the ability to embed HTML. The syntax was similar to Perl but was more limited, simpler, and less consistent.Zeev Suraski and Andi Gutmans, two Israeli developers at the Technion IIT, rewrote the parser in 1997 and formed the base of PHP 3, changing the language's name to the recursive initialism **PHP:HypertextPreprocessor.** The development team officially released PHP/FI 2 in November 1997 after months of beta testing. Afterwards, public testing of PHP 3 began, and the official launch came in June 1998. Suraski and Gutmans then started a new rewrite of PHP's core, producing the Zend Engine in 1999. They also founded Zend Technologies in Ramat Gan, Israel.

On May 22, 2000, PHP 4, powered by the Zend Engine 1.0, was released. On July 13, 2004, PHP 5 was released, powered by the new Zend Engine II. PHP 5 included new features such as improved support for object-oriented programming,the PHP Data Objects extension (which defines a lightweight and consistent interface for accessing databases), and numerous performance enhancements. The most recent update released by The PHP Group is for the older PHPversion 4 code branch.In 2008, PHP 5 became the only stable version under development.

Late static binding has been missing from PHP and will be added in version 5.3. PHP 6 is under development alongside PHP 5. Major changes include the removal of register_globals, magic quotes, and safe mode. The Reason for the removals was because register_globals had given way to securityholes, and magic quotes had an unpredictable nature, and was best avoided. Instead, to escape characters, Magic quotes may be substituted with the addslashes() function, or more appropriately an escape mechanism specific to the database vendor itself like mysql_real_escape_string() for MySQL.

PHP does not have complete native support for Unicode or multibyte strings; Unicode support will be included in PHP 6. Many high profile open source projects ceased to support PHP 4 in new code as of February 5, 2008, due to the GoPHP5 initiative, provided by a consortium of PHP developers promoting the transition from PHP 4 to PHP 5. It runs in both 32-bit and 64-bit environments, but on Windows the only official distribution is 32-bit, requiring Windows 32-bit compatibility mode to be enabled while using IIS in a 64-bit Windows environment. There is a third-party distribution available for 64-bit Windows

USAGE

PHP is a general-purpose scripting language that is especially suited for web development. PHP generally runs on a web server, taking PHP code as its input and creating web pages as output. It can also be used for Command-line scripting and client-side GUI applications.

PHP can be deployed on most web servers, many operating systems and platforms, and can be used with many relational database management systems. It is available free of charge, and the PHP Group provides the complete source code for users to build, customize and extend for their own use.

PHP primarily acts as a filter, taking input from a file or stream containing text and/or PHP instructions and outputs another stream of data; most commonly the output will be HTML. It can automatically detect the language of the user. From PHP 4, the PHP parser compiles input to produce bytecode for processing by the Zend Engine, giving improved performance over its interpreter predecessor.

Originally designed to create dynamic web pages, PHP's principal focus is server-side scripting,and it is similar to other server-side scriptinglanguages that provide dynamic content from a web server to a client, such as Microsoft's Active Server Pages, Sun Microsystems' JavaServer Pages, and mod_perl. PHP has also attracted the development of many frameworks that provide building blocks and a design structure to promote rapid application development (RAD). Some of these include CakePHP, Symfony, CodeIgniter, and ZendFramework, offering Features similar to other web application frameworks.

As of April 2007, over 20 million Internet domains were hosted on servers with PHP installed, and PHP was recorded as the most popular Apache module. Significant websites are written in PHP including the userfacing portion of Facebook, Wikipedia (MediaWiki), Yahoo!, MyYearbook, , Digg, Wordpress and Tagged. In addition to server-side scripting, PHP can be used to create

stand-alone, compiled applications and libraries, it can be used for shell scripting, and the PHP binaries can be called from the command line.

Input Design

The system design is divided in to two portions. The Administrator section and the User(student's) section.

Administrator

1. The Administrator can allot different students to the different hostels.

2. He can vacate the students for the hostels.

3. He can control the status of the fee payement.

4. He can edit the details of the students.He can change their rooms, edit and delete the student records.

A process of converting user originated inputs to a computer-based format. Input design is an important part of development process since inaccurate input data are the most common cause of errors in data processing. Erroneous entries can be controlled by input design. It consists of developing specifications and procedures for entering data into a system and must be in simple format. The goal of input data design is to make data entry as easy, logical and free from errors as possible. In input data design, we design the source document that

capture the data and then select the media used to enter them into the computer.

There are two major approaches for entering data in to the computer .

They are

· Menus.

· Dialog Boxes.

Menus

A menu is a selection list that simplifies computer data access or entry. Instead of remembering what to enter, the user chooses from a list of options. A menu limits a user choice of response but reduce the chances for error in data entry.

Dialog Box

Dialog boxes are windows and these windows are mainly popup, which appear in response to certain conditions that occur when a program is run. It

allows the display of bitmaps and pictures. It can have various controls like buttons, text boxes, list boxes and combo boxes. Using these controls we can make a 'dialog' with the program.

The proposed system has three major inputs. They are Machine Registration, Machine Scheduling and Request Form.

Process Design

Process design plays an important role in project development. In order to understand the working procedure, process design is necessary. Data Flow Diagram and System Flow chart are the tools used for process design.

System Flow Chart is a graphical representation of the system showing the overall flow of control in processing at the job level; specifies what activities must be done to convert From a physical to logical model.

Data Flow Diagram is the logical representation of the data flow of the project. The DFD is drawn using various symbols. It has a source and a destination. The process is represented using circles and source and destination are represented using squares. The data flow is represented using arrows. One reader can easily get the idea about the project through Data Flow Diagram

CHAPTER 5

SYSTEM TESTING

System testing is the stage of implementation, which is aimed at ensuring that the system works accurately and efficiently before live operation commences.Testing is the process of executing the program with the intent of finding errors and missing operations and also a complete verification to determine whether the objectives are met and the user requirements are satisfied. The ultimate aim is quality assurance.

Tests are carried out and the results are compared with the expected document. In the case of erroneous results, debugging is done. Using detailed testing strategies a test plan is carried out on each module. The various tests performed in "**Network Backup System**" are unit testing, integration testing and user acceptance testing.

Unit Testing

The software units in a system are modules and routines that are assembled and integrated to perform a specific function. Unit testing focuses first on modules, independently of one another, to locate errors. This enables, to detect errors in coding and logic that are contained within each module. This testing includes entering data and ascertaining if the value matches to the type and size supported by java. The various controls are tested to ensure that each performs its action as required.

Integration Testing

Data can be lost across any interface, one module can have an adverse effect on another, sub functions when combined, may not produce the desired major functions.Integration testing is a systematic testing to discover errors associated within the interface.The objective is to take unit tested modules and build a program structure.

All the modules are combined and tested as a whole. Here the Server module and Client module options are integrated and tested. This testing provides the assurance that the application is well integrated functional unit with smooth transition of data.

User Acceptance Testing

User acceptance of a system is the key factor for the success of any system. The system under consideration is tested for user acceptance by constantly keeping in touch with the system users at time of developing and making changes whenever required.

CHAPTER 6

SYSTEM IMPLEMENTATION

IMPLEMENTATION:

The Drawbacks of the existing system is when emergency situation occurs the user cannot set the alert function when they are in risk situation and immediately they cannot pass their location to friends and family members to intimate they are in risk.

Some of the existing comprises of three coloured buttons based on the seriousness of a situation. So, you can tap the one you want depending on your situation. The problem withexisting app sends panic alerts to emergency contacts in a problematic situation.

The proposed system has the following

advantages compared to other approaches that

currently existing system exist for:

❖ Unlike other apps work only at danger, our

app can be used as precaution measure.

❖ Easy to use and friendlyinterface.

CHAPTER 7

CONCLUSION AND FUTURE ENHANCEMENT

CONCLUSION:

To conclude the description about the project : The project, developed using PHP and MySQL is based on the requirement specification of the user and the analysis of the existing system, with flexibility for future enhancement.

The expanded functionality of today's software requires an appropriate approach towards software development. This hostel management software is designed for people who want to manage various activities in the hostel. For the past few years the number of educational institutions are increasing rapidly.

Thereby the number of hostels are also increasing for the accommodation of the students studying in this institution. And hence there is a lot of strain on the person who are running the hostel and software's are not usually used in this context. This particular project deals with the problems on managing a hostel and avoids the problems which occur when carried manually.

Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system which is more user friendly and more GUI oriented.

FUTURE ENHANCEMENT:

This project has an efficient scope in coming future where the output of this project will be used as an input for to get hostel outpass very quickly and will be helpful for the students and staffs on level of impact on time management and also we can avoid fake outpasses.

APPENDICES

APPENDIX – 1

SAMPLE SOURCE CODE

STAFF HOMEPAGE:

staff page:

```php
<?php
include "configs.php";

session_start();

if(isset($_SESSION['apn']))
{

  if(isset($_GET['application_number'])){
    $apn= $_GET['application_number'];

  }
  if(isset($_GET['tname'])){
    $tname = $_GET['tname'];
  }
```

```php
    $sql_query = "SELECT username  from admin where application_number=
$apn ";
